

Smart on FHIR enables Innovative Solutions

APEHC

April 20, 2023 Hong Kong STP

Grahame Grieve

Origin of FHIR: the state of Healthcare

- Health care has broken processes
- Other industries are being transformed
 - IT enables process transformation
- “Patient Centered Ecosystem” is happening very slowly in healthcare
 - IT standards to integrate B2B and C2B do not exist
 - IT is not properly implemented
 - There are many other blockers (culture, business process, liability, regulation)
 - Innovation is *hard* work – network problem

FHIR: The web, for Healthcare

Open Community

- Make it easier to exchange healthcare information
- Open Participation - uses web infrastructure (social media)
- Lead by HL7 - deeply connected to world wide health community

Open Standard

- Describes how to exchange healthcare information
- Public Domain (<http://hl7.org/fhir>)
- A web API - web standards where possible
- Continuity with existing healthcare standards

FHIR: Healthcare API

- “Application Programming Interface”: A list of operations that other programs can use
- Web APIs: operations offered using web technologies, work remotely across the internet (or locally)
- FHIR offers healthcare services:
 - What are the patient details?
 - Fetch Laboratory reports for a patient
 - Prescribe a medication for the patient
 - Suggest a treatment option for a patient based on diagnostic reports
 - etc

Freely available

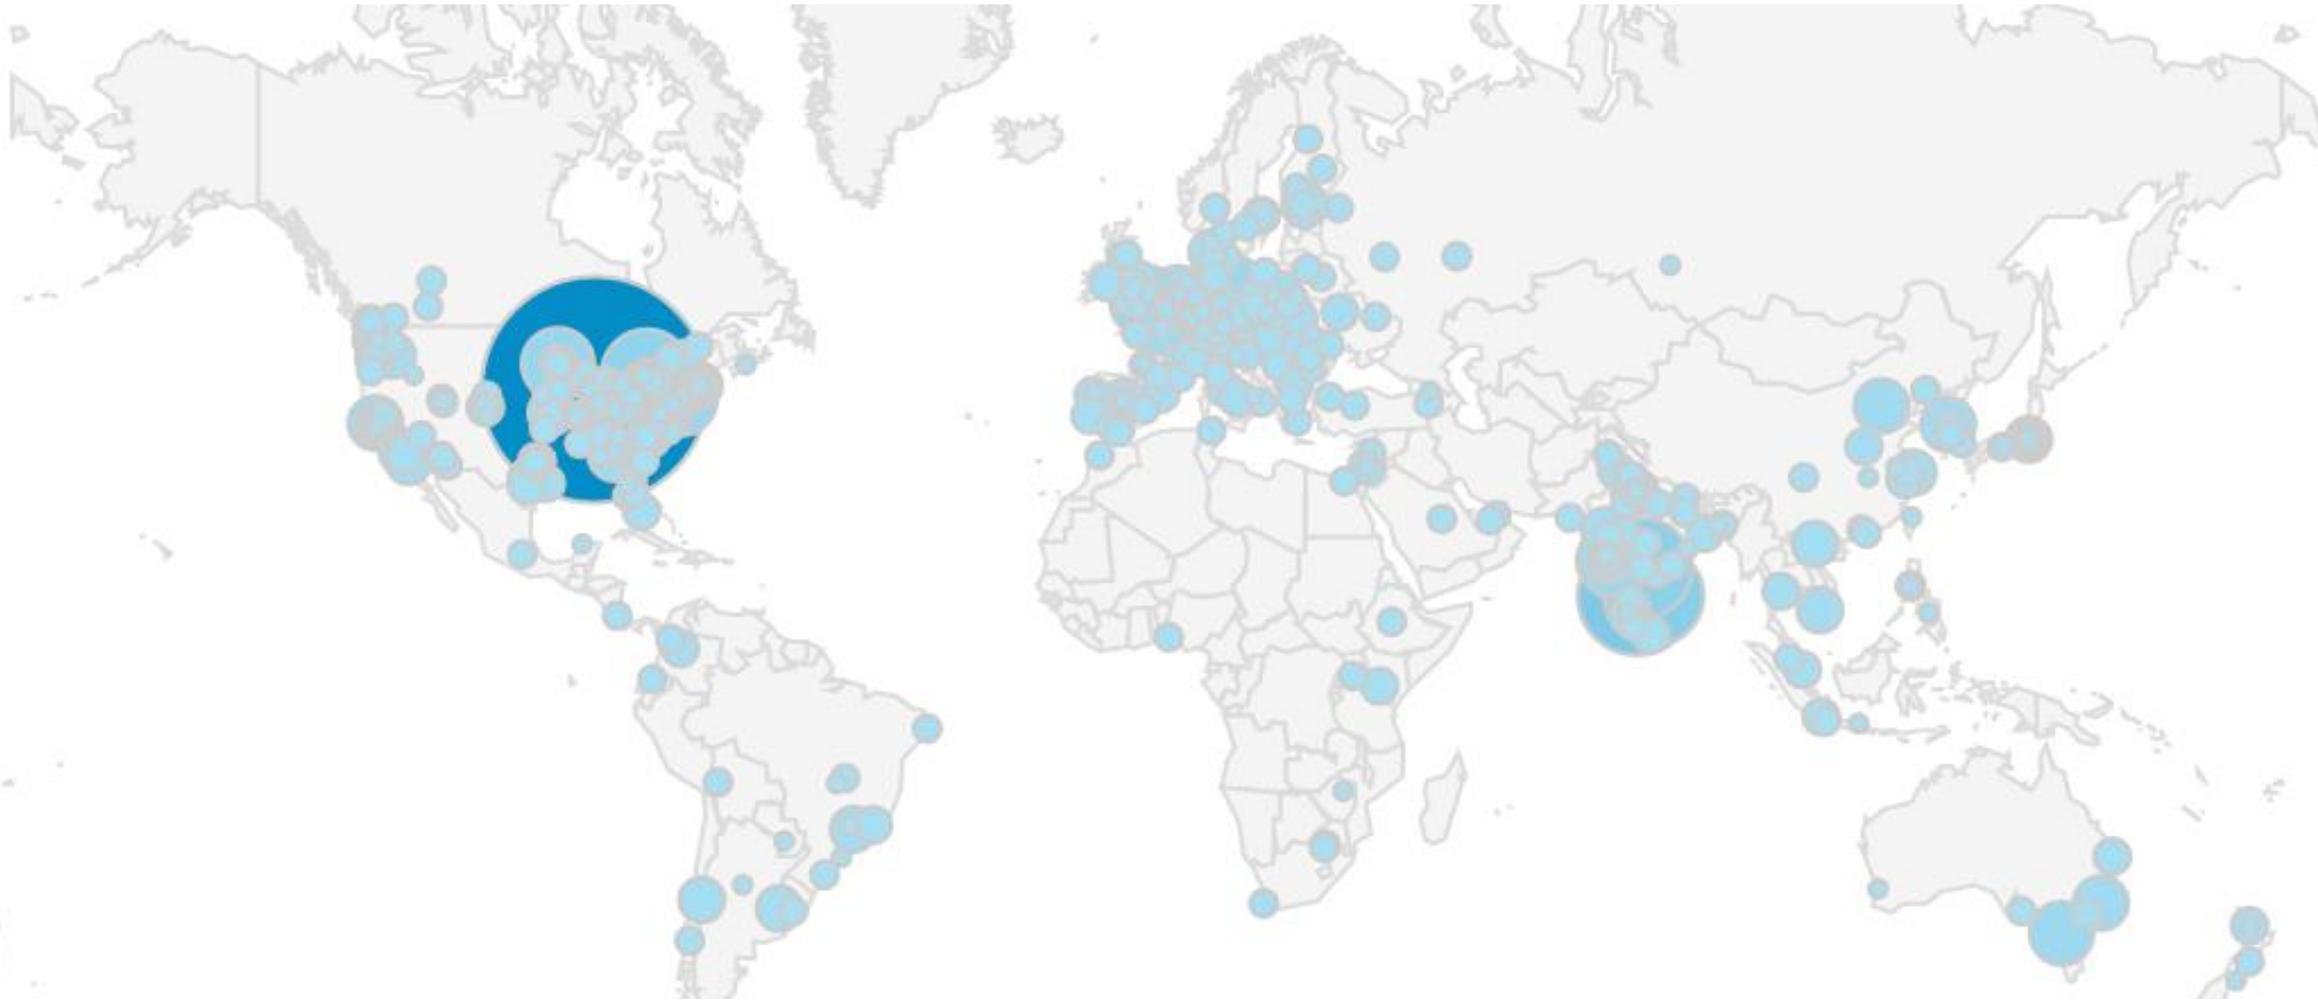

- Known address: <http://hl7.org/fhir>
- License: Creative Commons Public Domain (CC0):
 - “No Rights Reserved”
 - You can copy, modify, distribute and perform the work, even for commercial purposes, all without asking permission
 - The most open of open licenses
- Anyone can do anything with the content
 - There can be no disputes about ownership of rights to do anything with the FHIR content - HL7 waived its rights
 - HL7 Does protect the trademark / logo

About HL7

- HL7 = Health Level 7
 - 7 = Obscure reference to obsolete network model: application exchange
- HL7 publishes Health care data exchange standards
 - V2 : healthcare messaging (“HL7”) – widely adopted
 - V3 : healthcare exchange modelling framework – not much adopted
 - CDA : Clinical Document Framework (MyHR, others)
 - FHIR : API for Healthcare data exchange, based on current technology
 - CCOW, CQL, Arden Syntax, others

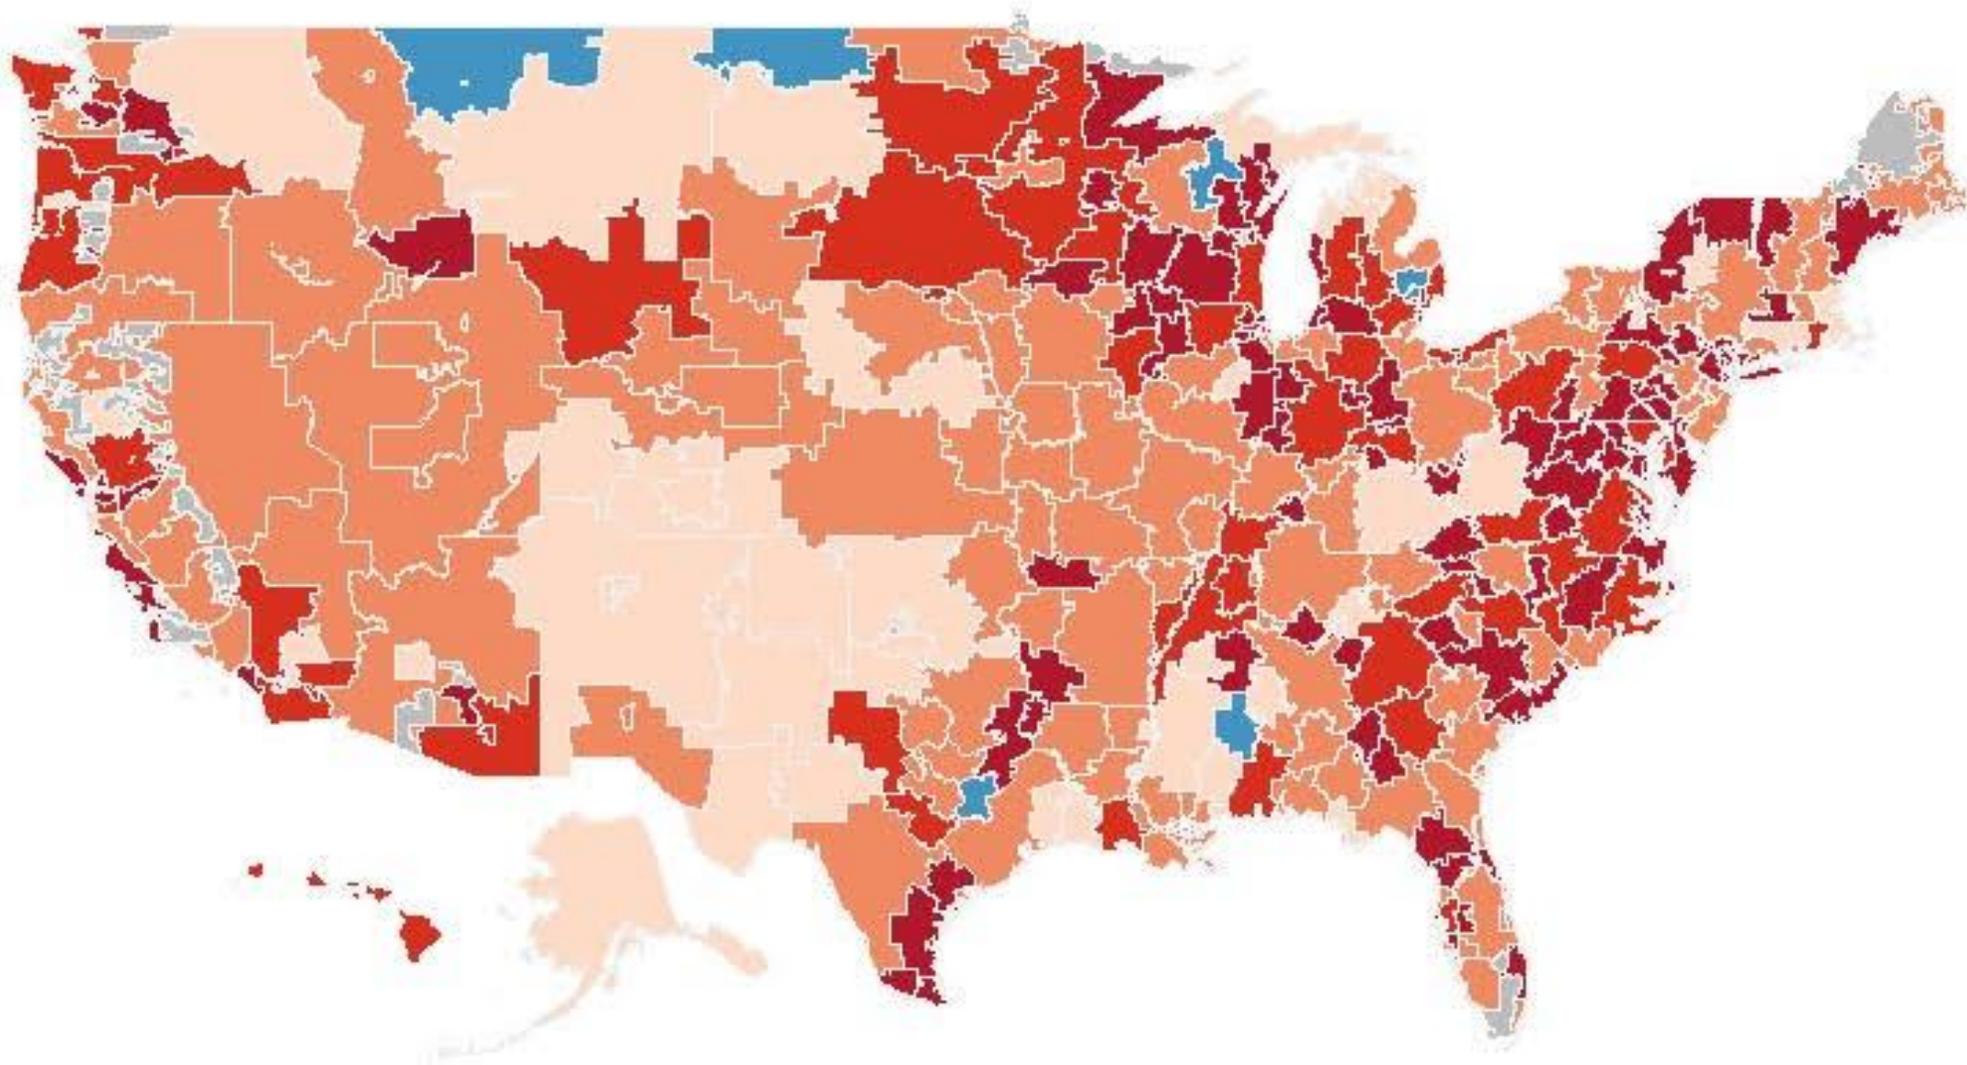

Building on the Idea

- A small passionate community rapidly grew around the idea
- Built specification, tools, demonstrations, web presence
- Took some exemplars into production
- Over time, community matured, governance stabilised & reconciled
- Selected by Argonaut (US EHR vendors) + Apple for C2B use
 - various national uses (e.g. English NHS)
- More pilots, more success around the world
- Rapid growth in community – meetings, social media,

% w/ FHIR

Why SMART?

- Major Problem: Clinical record systems (LIS / EHR) have massive amounts of data
- All sorts of interesting clinical / business rules could help
- Vendors can't do everything
- So:
 - Provide a General Purpose API that allows access to EHR data and services
 - With Integrated security
 - And a way to launch application in a child window

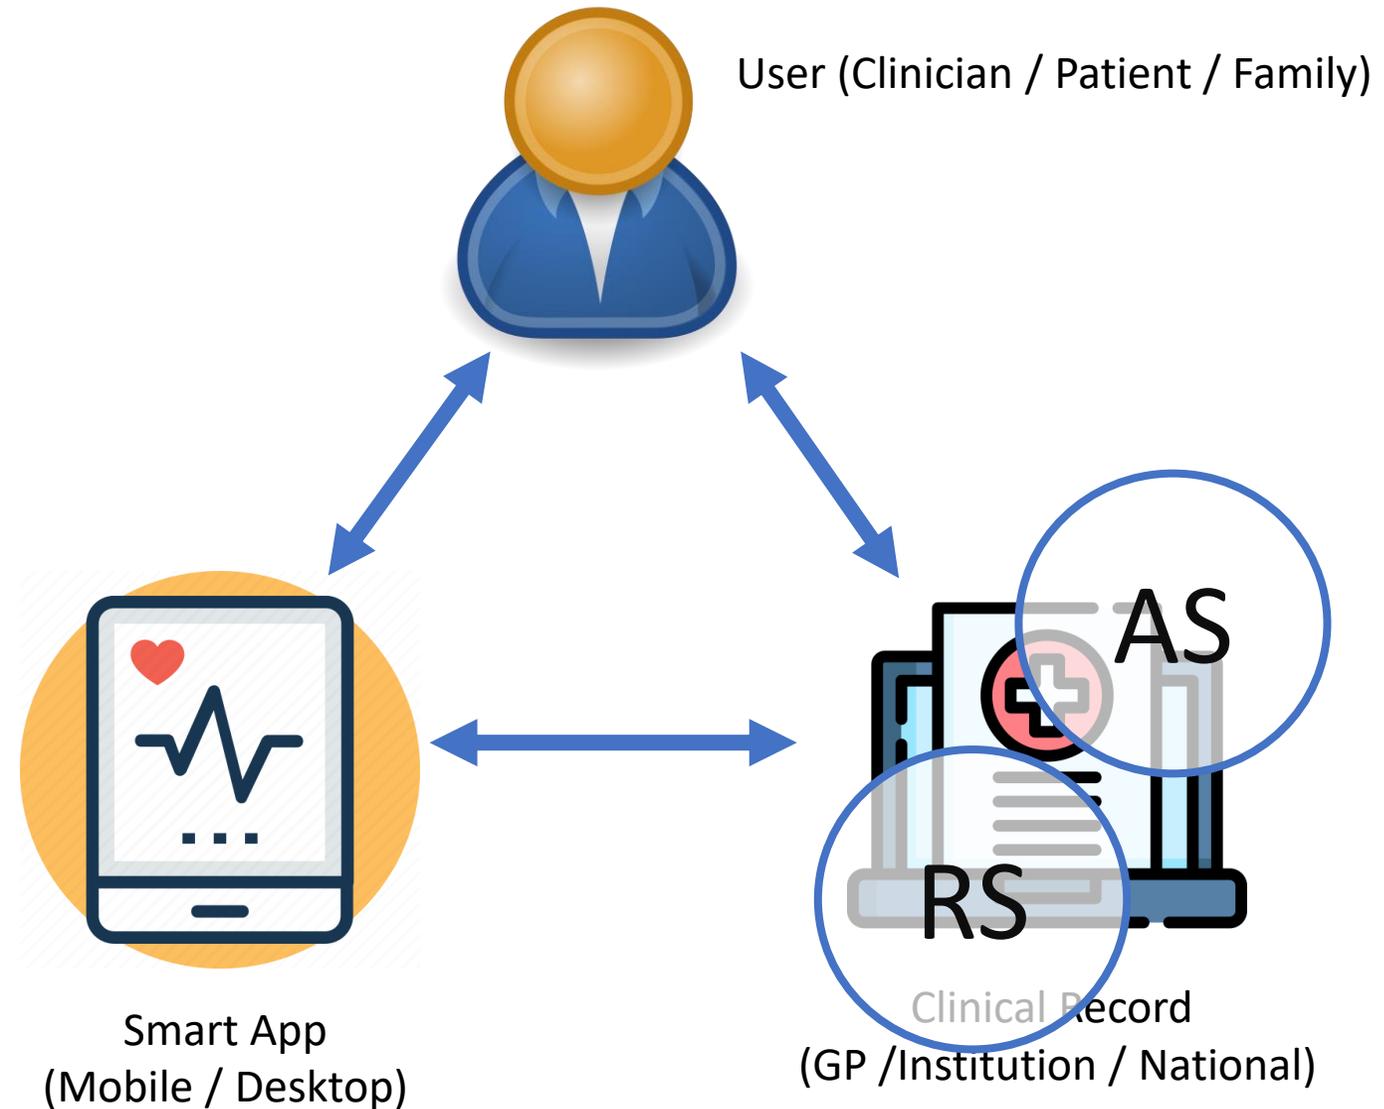

SMART: Substitutable Medical Apps, Reusable FHIR Technology

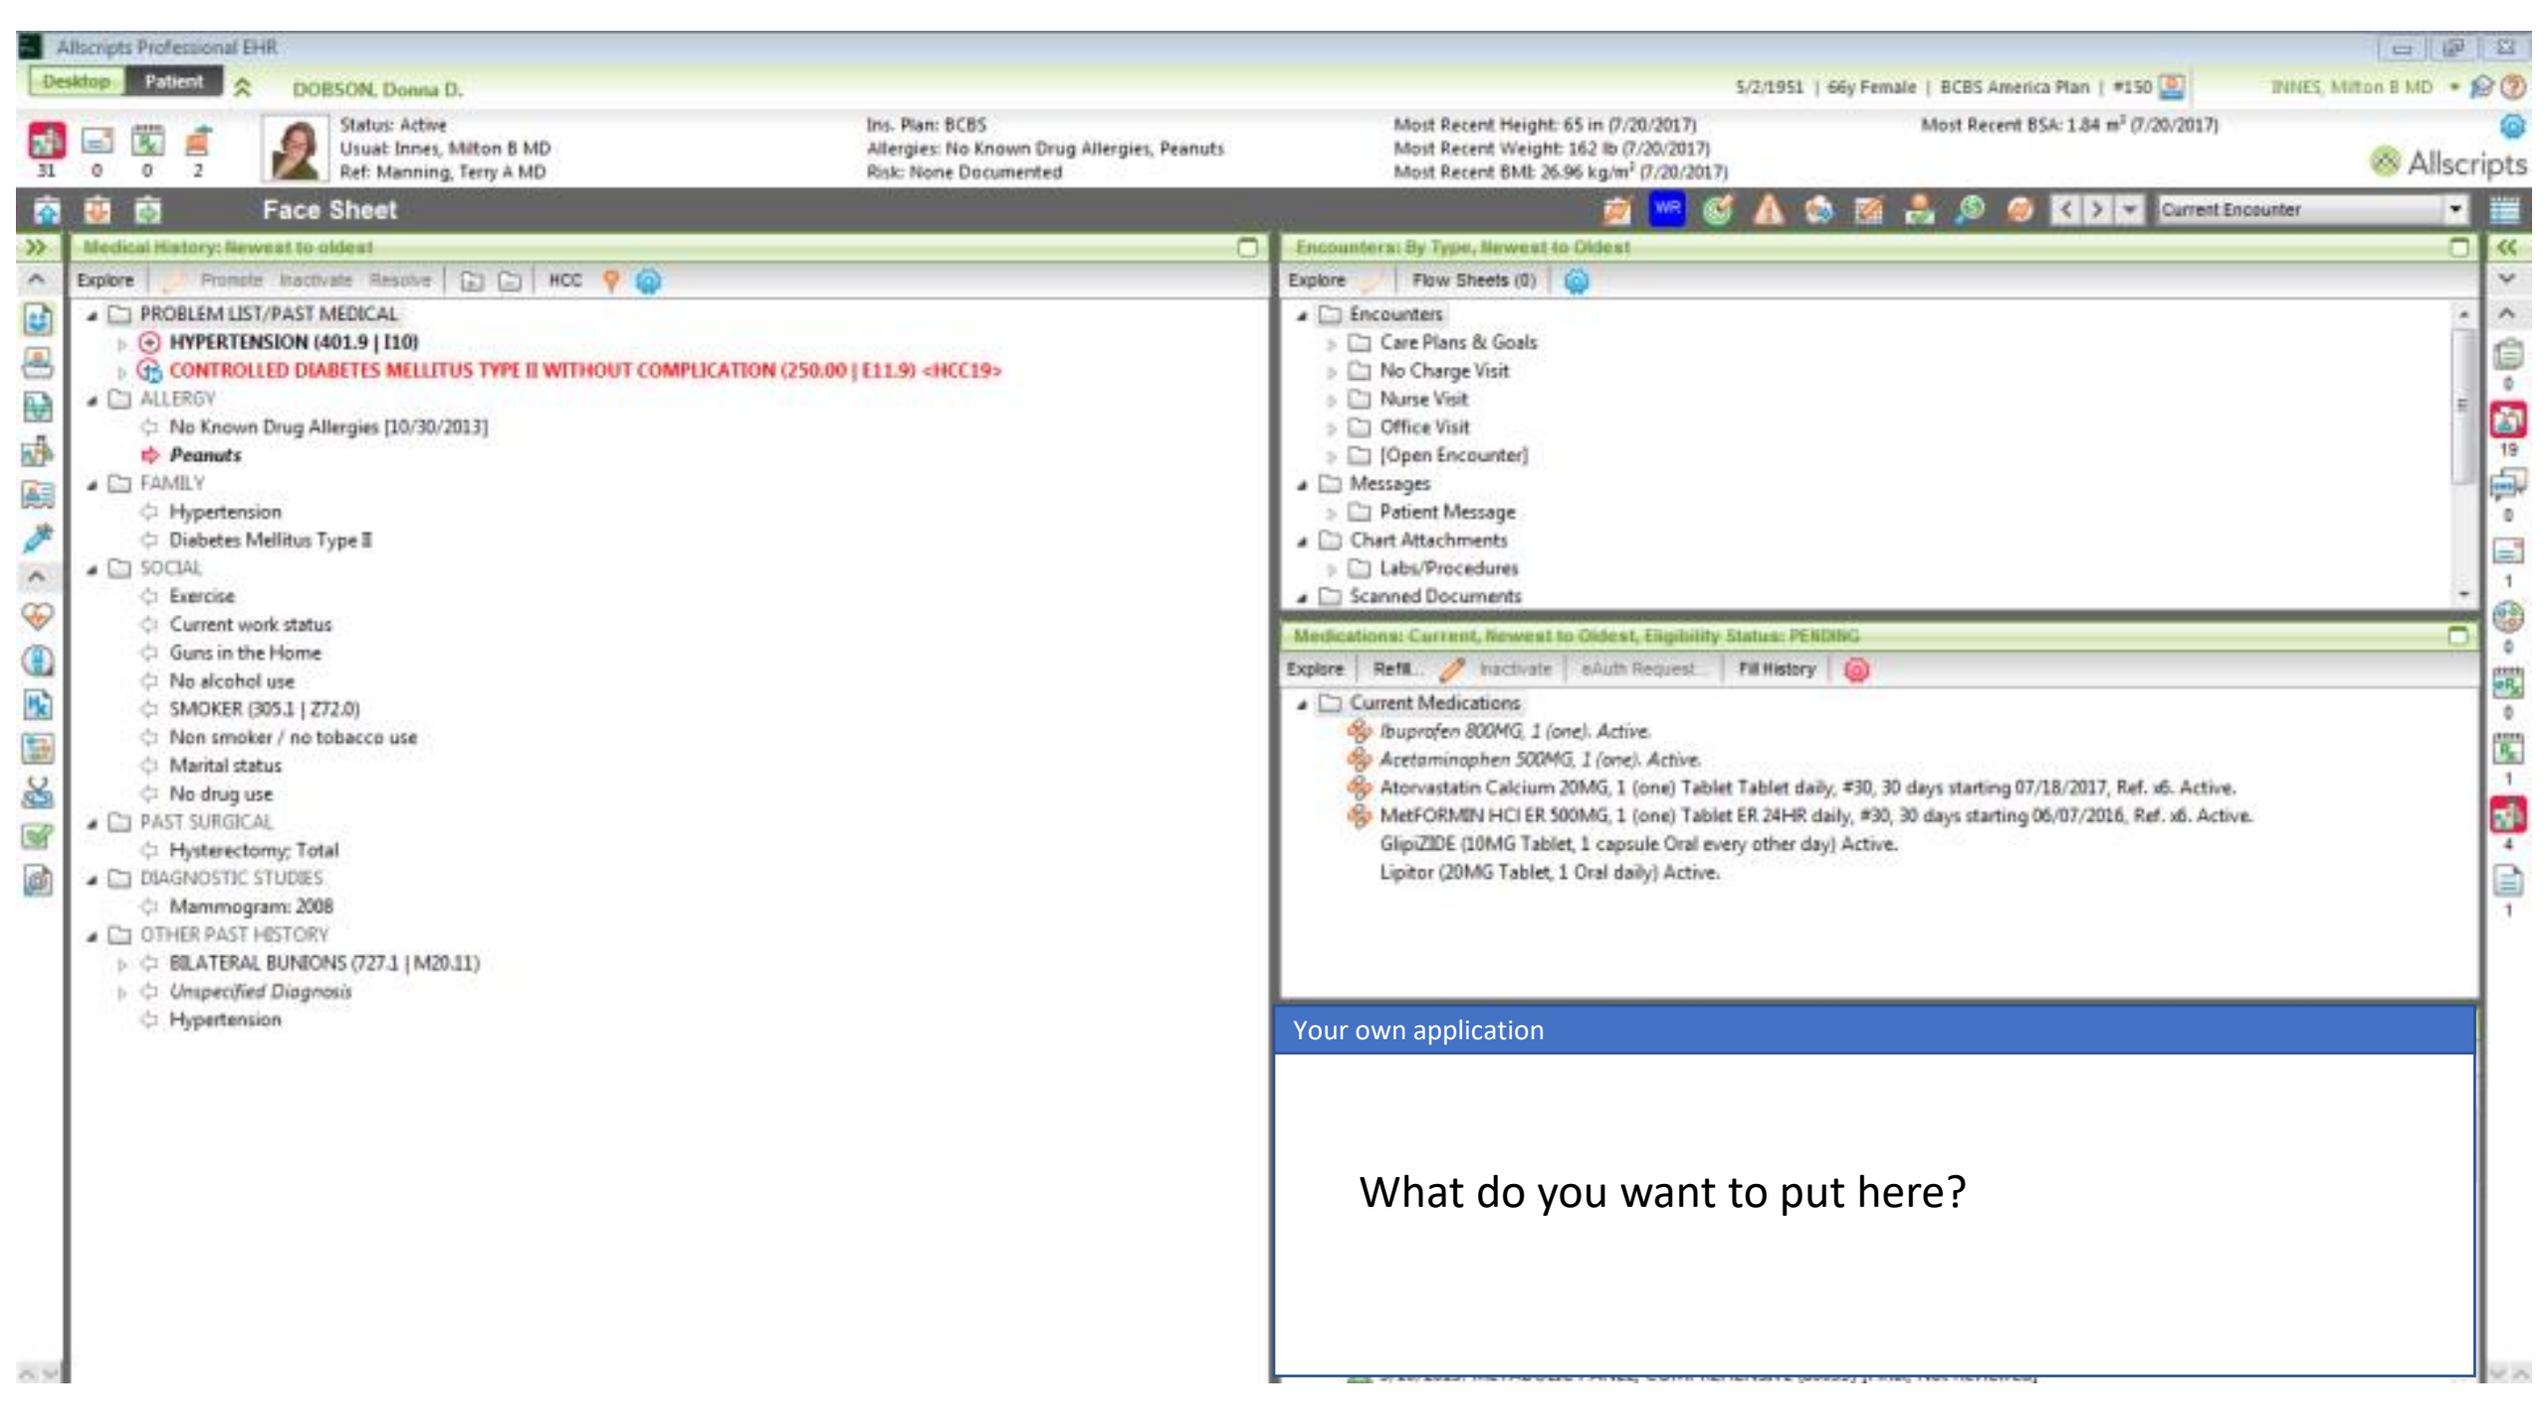

- FHIR – Access Clinical Data & services (IPS/CDI)
- OAuth – Identify User & Get permission
- Clinical Context – Integrate workflow and presentation

SMART: Substitutable Medical Apps, Reusable FHIR Technology

- FHIR – Access Clinical Data & services (IPS/CDI)
- OAuth – Identify User & Get permission
- Clinical Context – Integrate workflow and presentation

Face Sheet

- Medical History: Newest to oldest
 - PROBLEM LIST/PAST MEDICAL
 - HYPERTENSION (401.9 | I10)
 - CONTROLLED DIABETES MELLITUS TYPE II WITHOUT COMPLICATION (250.00 | E11.9) <HCC19>
 - ALLERGY
 - No Known Drug Allergies [10/30/2013]
 - Peanuts
 - FAMILY
 - Hypertension
 - Diabetes Mellitus Type II
 - SOCIAL
 - Exercise
 - Current work status
 - Guns in the Home
 - No alcohol use
 - SMOKER (305.1 | Z72.0)
 - Non smoker / no tobacco use
 - Marital status
 - No drug use
 - PAST SURGICAL
 - Hysterectomy: Total
 - DIAGNOSTIC STUDIES
 - Mammogram: 2008
 - OTHER PAST HISTORY
 - BILATERAL BUNIONS (727.1 | M20.11)
 - Unspecified Diagnosis
 - Hypertension

- Encounters: By Type, Newest to Oldest
 - Encounters
 - Care Plans & Goals
 - No Charge Visit
 - Nurse Visit
 - Office Visit
 - [Open Encounter]
 - Messages
 - Patient Message
 - Chart Attachments
 - Labs/Procedures
 - Scanned Documents

- Medications: Current, Newest to Oldest, Eligibility Status: PENDING
 - Current Medications
 - Ibuprofen 800MG, 1 (one), Active.
 - Acetaminophen 500MG, 1 (one), Active.
 - Atorvastatin Calcium 20MG, 1 (one) Tablet Tablet daily, #30, 30 days starting 07/18/2017, Ref. x6. Active.
 - MetFORMIN HCl ER 500MG, 1 (one) Tablet ER, 24HR daily, #30, 30 days starting 06/07/2016, Ref. x6. Active.
 - Glipizide (10MG Tablet, 1 capsule Oral every other day) Active.
 - Lipitor (20MG Tablet, 1 Oral daily) Active.

Your own application

What do you want to put here?

Extensible Clinical Record Systems

- Launch apps that can access patient record
- Add a way to inject 'suggestions' into the application
 - E.g. what things could/should you do for this patient?
- Write your own surveillance/management tools
- Examples in production:
 - Custom advanced dosing regimes ('DoseMe')
 - Risk calculators (by many clinical risk ratings)
 - Case Registration applications
 - Apple Health (/Personal Health access)

Smart, Joe
 Allergies: Allergies Not Recorded
 Care Team: View Details

DOB: 05/21/1988

Individualized Dose

2000 mg over 3.5 hours every 12 hours for 2 days

Target: AUC24: 450 mg.h/L
Predicted: AUC24: 437 mg.h/L

Peak	27.18 mg/l
Trough	10.7 mg/l
AUC24	437 mg.h/L

Plot Select

Guideline Dose*

1500 mg over 2.5 hours every 12 hours for 3 doses
** Non-severe Infection*

Peak	21.49 mg/l
Trough	7.58 mg/l
AUC24	328 mg.h/L

Plot Select

Label Dose

1000 mg over 2 hours every 12 hours for one day

Peak	15.24 mg/l
Trough	5.09 mg/l
AUC24	227 mg.h/L

Plot Select

Customize

Target Dose

Target AUC24
 AUC24 450 mg.h/L

Infusion Length
 3.5 hours

Dosing Interval 12 hours
Number of Doses 4

Calculate

Case Study: Personal Health Records

- 2010: the year of personal health records
- Each repository / clinical service cost \$\$\$:
 - Marketing, Sales
 - Contact Negotiations / Legal Fees
 - Development / testing / deployment
 - Maintenance, trouble shooting
- TCO: ~\$150k (US)

Case Study: Argonaut

- Government instigated project involving US EHR vendors
 - Vendors ran their own project
- Goal: define a public API for patients to get their own data
 - Secondary goal: use the same API for application extensibility
- Outcome: an industry specification for letting the patient get their healthcare summary –
 - Medications, Allergies
 - Labs, Vital Signs
 - Documents (/ Clinical Notes)
 - All done securely via SMART on FHIR

Case Study: Apple Healthkit

- Apple Healthkit uses Argonaut specification (US Only)
- Hospitals can register with Apple for free
- Hospitals get software with the capability for free
- Register with Apple for free
- Have to pass the Apple testing process (some weeks work)
- Have to maintain patient portal accounts

- Reduction in cost for PHR: >90% - it's a commodity

Smart Launch Sequence #1: Embedded

- EHR is configured to use a Smart Application (web/mobile)
- Creates a contained browser window. Sends browser to Application with a 'Launch Context'
- Application loads, and then sends browser to auth endpoint
- User discusses the request for access with the Auth server
- Auth server redirects to app with "auth" token
- App converts token to Access token
- App makes requests of EHR using Access token
- Until user/EHR closes it

Smart Launch Sequence #1: Stand Alone

- Application wishes to connect to EHR (Mobile/Web/Desktop/Server)
- Creates a browser (thing). Sends browser to auth endpoint
- User discusses the request for access with the Auth server
- Auth server redirects to Application (server) with “auth” token
- Application converts token to Access token
- Application makes requests of EHR using Access token
- Until EHR rejects the access token (go back to start)

Smart Launch Application Registration

- EHR decides which authorizations to approve
 - Subject to organizational policy and vendor decision making
- Most EHRs require applications to be registered in advance
 - Not necessary technically, but enforce policy and business practices
 - Enforce business agreements
 - Check security & useability
- This becomes the focus point of contention around financialization

Smart Launch User Authentication

- Smart App Launch doesn't require the user to be identified
 - But can be, and almost always needs to be
 - Authorization outcome may include user details (app can ask for this)
- Typically EHR must identify a user to decide what records are accessible
- Client may also need to authenticate user for it's own purposes
 - Unless it can match records from EHR details
 - Can set up SSO arrangements with EHR
- EHR can delegate user authentication (e.g. national service) using 2nd stage OAuth (not Smart though)

Smart Launch: Scopes and Tokens

- EHR & Apps inject tokens (unique identifiers) into the process
 - Track context for both parties (e.g. Launch Context)
 - There are various encryption and signing steps to secure the exchange
- App requests a set of 'scopes'. EHR grants a set of scopes
 - Each scope has scope/type.mode e.g. patient/Observation.rs
 - EHR can grant more or less access, depending on internal policies, institution policies, user rights etc
 - Scopes are a language for the interaction with the user – what is the app proposing to do?

Why use SMART on FHIR?

- All the advantages of FHIR, e.g.:
 - Free Open Source Specification
 - Leverage Web technology / security / community
 - Active & helpful FHIR community
- Can use other standards
 - V2 – designed for back-office exchange
 - CDA / XDS – designed for historical record collection
- Can do it your own way (down with standards)

Standards Cost More!

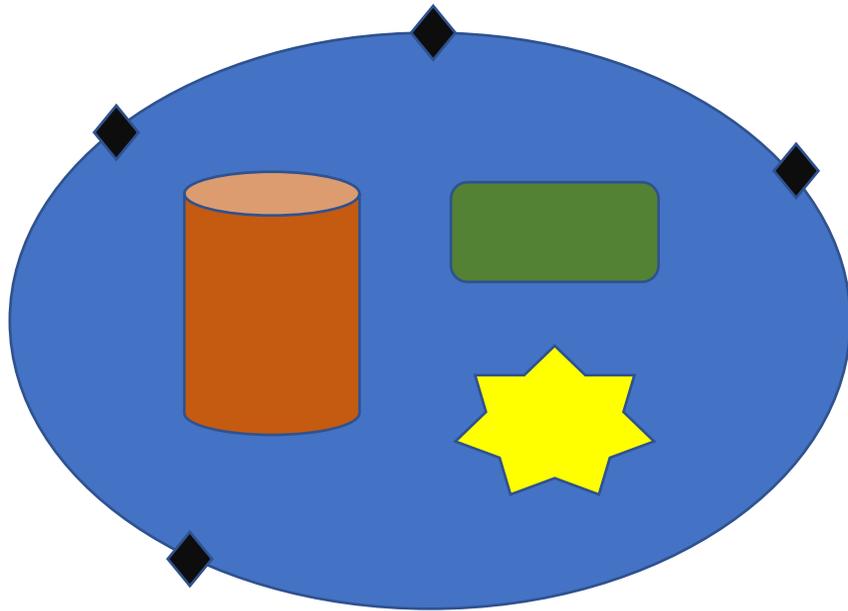

- Standards increase up front costs
 - Encountering requirements you don't (*yet*) have
 - More development than a custom agreement
- Standards decrease follow up costs
 - More re-use of work in the future
 - Less re-work (safer! Lower Risk!)
 - Easier (cheaper) to find staff & maintain institutional memory
 - More likely to be compliant with regulation
- Can't achieve data lock-in by dead-end-thinking

Software Process

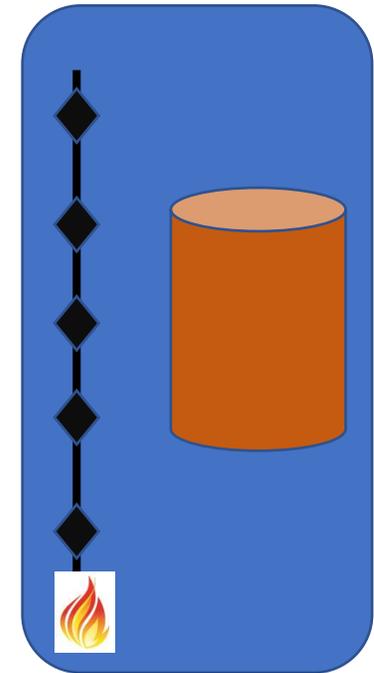

- Most clinical systems are extremely configurable
- In fact: frameworks for systems, not systems
- Extensive implementation project to build a custom configuration
- ‘ERP style software’ e.g. SAP – organization spends significant portion of budget managing it’s own special business rules
- ‘SaaS style software’ – much reduced customization saves an organization real budget
 - Eating the market from small → large
 - Based on ‘Deep Interoperability’

Shallow vs Deep Interoperability

- Integration points on the perimeter:

- Integration Points part of the system:

Hacking FHIR: Is it secure?

- Alissa Knight is a professional hacker who was paid to hack production APIs and publish her results
- EHRs were very secure.
Other Apps: very insecure
- This is scary! Why use FHIR?
- Because you will be hacked – so why not be part of the solution?

Lessons Learned - Alissa

- Public notification of a security breach will generate real controversy
- Much of it misinformed & some of it malicious
- There will be real political costs
- Handling it properly pays off – be prepared
- Ecosystems based on open standards are more resilient
 - Economics justifies white hat hacking

Lessons Learned

- Implementers are all over the place
 - Some implementers are very good indeed
 - Some implementers are not!
 - Culture matters. Leadership matters
- Solutions vary widely between jurisdictions
 - Responding to different risks, driven by different purchasing choices
- Implementers / adopters that are suspicious of new technologies (cloud) are not suspicious enough of their existing practices

FHIR is not a silver bullet

- FHIR is a nice technology
- The FHIR specification only captures what everyone will agree to
 - “Platform” on which to build agreements
- People still have to agree about everything else
 - Countries
 - Domains
 - Terminologies
 - Business Agreements / workflows
 - Framework & Motivation for introducing it

Building Community

- Strategy / Architecture
 - Vendors and institutions need leadership to get over co-dependency issues
- Education
 - Formal education (University)
 - Professional education
- Learning / Testing Opportunities
 - “Connectathons” / Sandbox - opportunities for technical teams to test/learn with no risk
- Local Specifications
 - Convert local issues to local specifications – regulation, language, accepted business practices

International Specifications

- **IPS: International Patient Summary**
 - A set of agreed summary information about a patient
 - Common Content + Terminology rules
 - Portable as they travel (tourist/refugees/civil disruption)
 - Doesn't specify how transfer happens – can be by Smart on FHIR
- **IPA: International Patient Access**
 - A common way to access information for a patient in any country
 - Unbundle US Patient access from US Specific content rules
 - Because consumer technology is international in focus
 - Doesn't make rules about content, just how to access information
 - Smart on FHIR for patients

Patient Oriented Systems

- Clinical systems and their safety is often measured ‘compartmently’
- Patient outcomes are hard to measure and hard to improve
- Patients have little influence over the process or the outcomes

- FHIR Project has the ultimate goal of improving patient outcomes

Empowering Patients

- Make data accessible to Patients
 - Make data from patients accessible to system
 - Allowing patient to control data sharing between parties
 - Creating a single common patient record
-
- But: Services not Data are empowering
 - FHIR offers the ability to extend services to the patient

Coordinated Care

- Common Frustration of Patients:
 - Scheduling/Communication problems
 - Conflicting care plans / payment options
 - Conflicting system definitions of success
 - Must be resolved by the patient
- FHIR enables Services for
 - distributed care plan
 - virtual clinical review
- Virtual Institutions (internet hospitals, institutional boundaries)
- Integrated Home Care (medication management)

FHIR & Disruption

FHIR disrupts healthcare (& healthcare IT):

- Significantly reducing the cost of data exchange
- Making it easy and natural to use the web
- Encouraging the development of open community
- Building a solid base to scale computation about healthcare

At the same time as wider web / open community transforms are happening.
